ABSTRACT

A system (100) provides speaker identification training. The system (100) generates speaker models and receives audio segments. The system (100) identifies speakers corresponding to the audio segments based on the speaker models. At least one of the audio segments has an unidentified or misidentified speaker (i.e., an audio segment whose speaker cannot be accurately identified). The system (100) presents, to a user, audio segments that include an audio segment whose speaker is unidentified or misidentified and receives, from the user, the name of the unidentified or misidentified speaker. The system (100) may use this information to subsequently identify the unidentified or misidentified speaker by name for future audio segments.
